

B50A SERIES PWM SERVO AMPLIFIERS

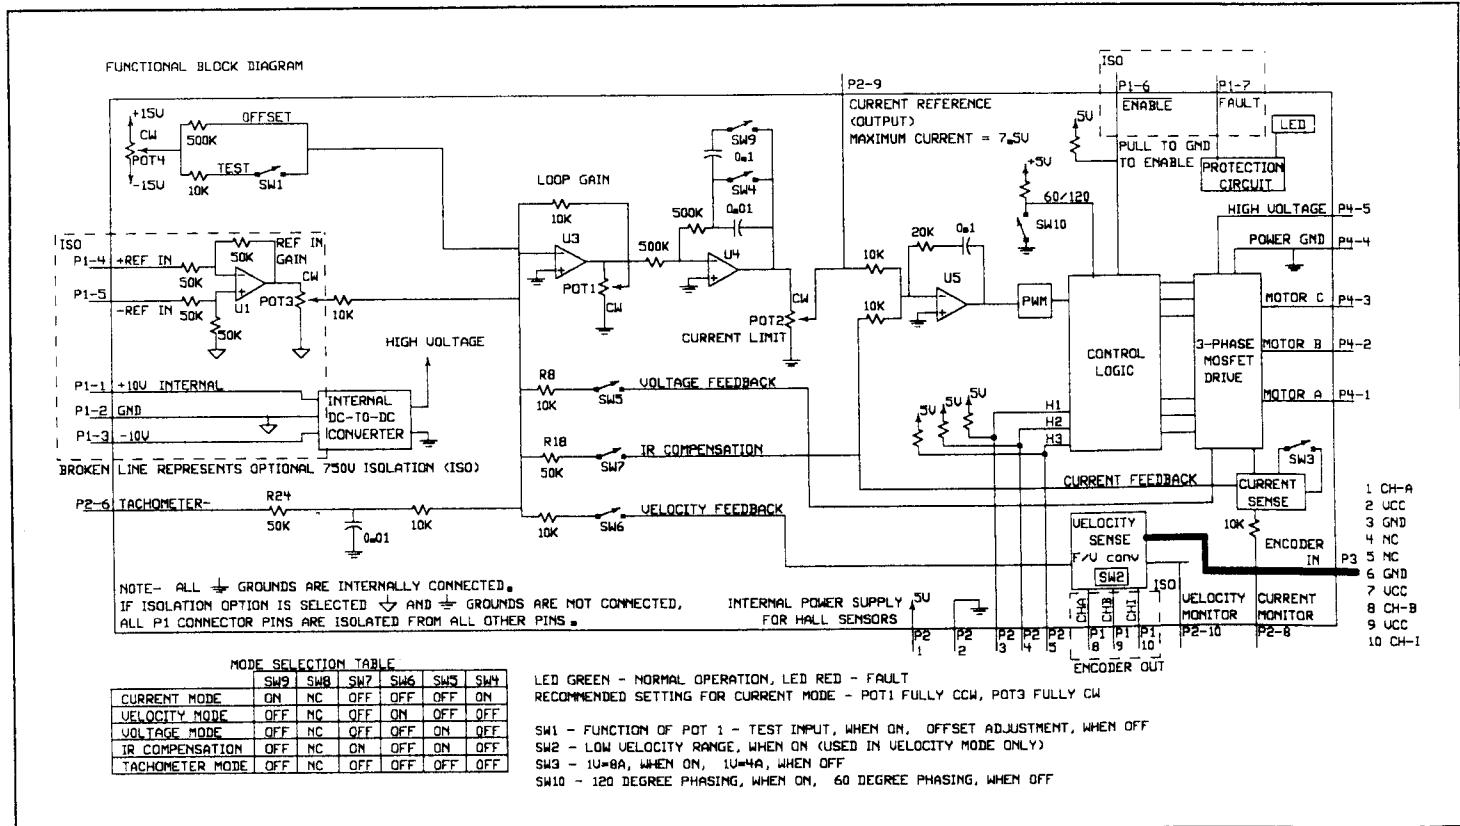

MODELS: B50A8, B50A20

FEATURES:

- * Surface-mount technology
- * Small size, low cost, ease of use
- * Optional input signal isolation for off-the-rectified 120 VAC line operation
- * DIP switch selectable: current, velocity, open loop control
- * Four quadrant regenerative operation

DESCRIPTION: B50A Series PWM servo amplifiers are designed to drive brushless DC motors at a high switching frequency. Operating efficiency is 97%. All models are fully protected against over-voltage, over-current, over-heating and short-circuits. All models interface with digital controllers or can be used as a stand-alone system. They require only an unregulated single power supply. Loop gain, current limit, input gain and offset can be adjusted using 15-turn potentiometers. The offset adjusting potentiometer can also be used as an on-board input signal for testing purposes, when SW10 (DIP switch) is "On".
